<http://www.gametrailers.com/player/28542.html>

Georgia Institute of Technology

XNA GS Framework

- Built on Microsoft's .NET
 - Makes MS comfortable with letting "ordinary folks" program on the Xbox 360
- C# is standard language for XNA development
 - But in theory could use Managed C++, VB.NET, etc. on the PC

Georgia Institute of Technology

Xbox 360 uses .NET Compact Framework

- Some stuff available in .NET on the PC is missing
- Garbage collector on 360 isn't as smart as on the PC
- Caused the Schizoid team some trouble, as well as one semester of CS4455

Georgia Institute of Technology

Is managed code too slow for games?

- Vertigo Software ported Quake II to Managed C++, got 85% performance of the original C code
 - Should expect to do better if you have the .NET Common Language Runtime in mind from the beginning
- Xbox 360
 - GPU: 337 million transistors
 - CPU: 165 million transistors

Georgia Institute of Technology

XNA GS graphics

- XNA is built on top of DirectX 9
 - Not built on MDX or Managed DirectX
- DirectX 9 has a fixed function pipeline, but XNA doesn't!
 - Everything done with shaders
 - There is a BasicEffect to get you started

From XNA Team Blog, "What is the XNA Framework," blogs.msdn.com/xna/archive/2006/08/25/724607.aspx

Why no fixed-function pipeline? (1)

In Microsoft's own words (paraphrased):

- Programmable pipeline is the future
 - Neither Direct3D 10 or Xbox 360 have fixed-function pipeline
- Early adopters and customers said cross-platform goal more important than fixed-function pipeline

From XNA Team Blog, "What is the XNA Framework," blogs.msdn.com/xna/archive/2006/08/25/724607.aspx

Why no fixed-function pipeline? (2)

In Microsoft's own words (paraphrased):

- Fear is someone would start and finish their game using the fixed-function APIs, and then get dozens of errors when they tried to compile it on the Xbox 360
- Better to know your code works on both right from the beginning

From XNA Team Blog, "What is the XNA Framework," blogs.msdn.com/xna/archive/2006/08/25/724607.aspx

Some convenient things about XNA

- Don't need to mess with Win32-ish boilerplate (opening a window, etc.)
- Easy interfacing with the Xbox 360 controller (for both Windows and Xbox 360)
- Storage ("saved games") unified between Windows and Xbox 360
 - On Xbox 360, have to associate data with a user profile, put on hard drive or memory card, etc.
 - XNA "emulates" this on Windows

From XNA Team Blog, "What is the XNA Framework," blogs.msdn.com/xna/archive/2006/08/25/724607.aspx

Hello bluescreen

From XNA Team Blog, "What is the XNA Framework," blogs.msdn.com/xna/archive/2006/08/25/724607.aspx

```
public class SampleGame : Game {
    private GraphicsComponent graphics;

    public SampleGame() {
        this.graphics = new GraphicsComponent();
        this.GameComponents.Add(graphics);
    }

    protected override void Update() { }

    protected override void Draw() {
        this.graphics.GraphicsDevice.Clear(Color.Blue);
        this.graphics.GraphicsDevice.Present();
    }

    static void Main(string[] args) {
        using (SampleGame game = new SampleGame()) {
            game.Run();
        }
    }
}
```

Georgia Institute of Technology

Careful if you're on Windows x64

- XNA normally targets "AnyCPU"
- Will break when you try to run on x64 machines, since x64 versions XNA framework dlls don't exist (yet – maybe never?)
- Workaround: Change target to x86

Georgia Institute of Technology

Caveats about Xbox 360 development

- Many TVs cutoff 5-10% of the pixels around the edge
 - Keep text & important info away from there
- Xbox 360 handles post processing and render targets a little differently than the PC

Info from Alistair Wallis, "Microsoft XNA: A Primer," interview with Benjamin Nitschke www.gamecareerguide.com/features/328/microsofts_xna_a_php?page=4

Georgia Institute of Technology

Dream Build Play contest

- See <http://www.dreambuildplay.com>
- 2010's contest already over...
- ...but keep on the lookout for the 2011 Dream Build Play contest!

Georgia Institute of Technology

XNA Indie Games

- See <http://creators.xna.com>
- Join the XNA Creator's Club
 - The XNA CC memberships students get free from DreamSpark will let you run games on the 360, but may not let you take part in Indie Games
- Upload your game, rate content (violence, etc.)
- Peer review – confirm content ratings, check quality
- Can sell your game to Xbox 360 users!

Georgia Institute of Technology

Example: A Fading Melody

Georgia Institute of Technology

XNA CG sales (March 31, 2009)

Find Teddy	1-Feb-09	2,181	70	3.2%	400	\$338.80	\$237.16
Remote Masseuse	11-Feb-09	55,000	3,500	6.4%	200	\$8,470.00	\$5,929.00

Georgia Institute of Technology

Part 2: Game Loops

Georgia Institute of Technology

Credit to where it is due

- Koen Witters
 - Thinking about game loops
- Shawn Hargreaves
 - Details about XNA's game loop
- Side note: next few slides on game loops contain rough pseudocode

Simplest game loop (1)

```
running = true;
```

```
while(running) {
    update();
    draw();
}
```

- Draw() has things like `bad_guy.x += 1;`
- What could possibly go wrong?

<http://dewitters.koonsolo.com/gameloop.html>

Simplest game loop (2)

- Game runs faster on faster hardware, slower on slower hardware
- Less of a problem if hardware is well-defined; Apple II+, Commodore 64, game console
- Try an original Mac game on a Mac II: too fast!
- Big problem on PCs/Macs with varying speed
- Can still be a problem if update time varies from iteration to iteration (i.e. varying number of bad guys)
 - See Defender and Robotron: 2084

<http://dewitters.koonsolo.com/gameloop.html>

FPS dependent on constant GS (1)

```
running = true;
seconds_per_frame = 1/60;
```

```
while(running) {
    update();
    draw();
    if (seconds_per_frame_not_elapsed_yet)
        wait(remaining_time);
    else {
        oooops! We are running behind!
    }
}
```

- What could possibly go wrong?

<http://dewitters.koonsolo.com/gameloop.html>

FPS dependent on constant GS (2)

- Slow hardware:
 - If fast enough to keep up with FPS no problem
 - If not: game will run slower
 - Worst case: some times runs normally, sometimes slower – can make unplayable

<http://dewitters.koonsolo.com/gameloop.html>

FPS dependent on constant GS (3)

- Fast hardware:
 - Wasting cycles on desktops - higher FPS gives smoother experience, why not give that to the user?
 - Maybe not so bad philosophy on mobile devices – save battery life!
 - Also may not be bad if user wants to run other processes

<http://dewitters.koonsolo.com/gameloop.html>

GS dependent on variable FPS (1)

```
running = true;

while(running) {
    update(time_elapsed);
    draw();
}
```

- Use time_elapsed in your state update computations:

```
bad_guy.x += time_elapsed * bad_guy.velocity_x;
```
- What could possibly go wrong?

<http://dewitters.koonsolo.com/gameloop.html>

GS dependent on variable FPS (2)

- Slow hardware:
 - Game sometimes bogs down, i.e. when lots of stuff is on the screen
 - Slows down player and AI reaction time
 - If time step is too big:
 - Physics simulations may become unstable
 - “Tunneling” (need “swept collision detection”)

<http://dewitters.koonsolo.com/gameloop.html>

GS dependent on variable FPS (3)

- Fast hardware:
 - Shouldn't be a problem, right?
 - What could possibly go wrong?

<http://dewitters.koonsolo.com/gameloop.html>

GS dependent on variable FPS (4)

- Fast hardware:
 - More calculations per second for some quantity, more round off errors can accumulate
 - Multiplayer game: players with systems with different speeds will have game states drifting apart
 - Good example:
 - www.nuclex.org/articles/xna-game-loop-basics

<http://dewitters.koonsolo.com/gameloop.html>

Balancing act

- Want fast update rate...
- ...but still be able to run on slow hardware
- Many more possibilities

Photo by Aaron Sneddon; under the Creative Commons Attribution 3.0 Unported license

<http://dewitters.koonsolo.com/gameloop.html>

Constant GS indep. of variable FPS

- Update, at say, 25 times per second
 - Player input, AI, etc.
- Render faster on faster graphics hardware
 - Use interpolation to predict where objects should be
 - Makes it look like full game is running at a high frame rate
- Degrades gracefully on slower hardware

<http://dewitters.koonsolo.com/gameloop.html>

Tasks with different granularity

- Run often:
 - Physics engine location & orientation updates
 - 3-D character display
- Run less often:
 - Collision detection
 - Player input
 - Head-up display
- Run even less often:
 - “immediate A.I.”, networking
- Careful: A.I. might be unstable with larger time steps – not just physics!

Georgia Institute
of Technology

Example: MotoGP

- Main game logic: 60 updates per second
 - “input, sound, user interface logic, camera movement, rider animations, AI, and graphical effects”
- Physics: 120 updates per second
- Networking: 4 to 30 updates per second, depending on number of players – more players results in less often updates to conserve bandwidth

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

Georgia Institute
of Technology

XNA game loop: fixed step

- Game.IsFixedTimeStep = true; (default)
- XNA calls Update() every “TargetElapsedTime” (defaults to 1/60 seconds)
 - Repeat call as many times as needed to catch up with current frame (in XNA >= 2.0)
- XNA hopefully calls Draw(), then waits for next update
- If Update+Draw time < TargetElapsedTime, we get
 - Update
 - Draw
 - Hang out for rest of time (nice on Windows so other processes can run)

<http://blogs.msdn.com/shawnhar/archive/2007/11/23/game-timing-in-xna-game-studio-2-0.aspx>

Georgia Institute
of Technology

XNA may get behind (1)

- Why would
Update+Draw time > TargetElapsedTime?
 - Computer slightly too slow
 - Computer way too slow
 - Computer mostly fast enough, but may have too much stuff on screen, big texture load garbage collection
 - Paused program in debugger

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

Georgia Institute
of Technology

XNA may get behind (2)

- What happens if Update+Draw time > TargetElapsedTime?
 - Set GameTime.IsRunningSlowly = true;
 - Keep calling Update (without Draw) until caught up
 - Makes sure game is in right state with Draw finally happens
 - If too far behind... punt

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

When XNA gets behind (1)

- If computer slightly too slow: If can't handle Update+Draw in one frame, can probably handle Update+Update+Draw in two frames
 - May look jerky but should play OK
- If computer way too slow (i.e. Update alone doesn't fit in a single frame): we are doomed
- In both above cases, a clever program could see that GameTime.IsRunningSlowly == true and reduce level of detail
 - Most games don't bother

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

When XNA gets behind (2)

- If particular frame took too long: call update extra times to catch up, then continue as normal
 - Player may notice slight glitch
- If paused in debugger: XNA will get way behind and give up, but will continue running OK when debugger resumed

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

“Heisenberg Uncertainty Principle”

- If you put in breakpoints, may notice Update being called more often than Draw, since the breakpoint makes you late
- Examining the timing of a system changes the timing!

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

XNA game loop: Variable Step

- `Game.IsFixedTimeStep = false;`
 - Update
 - Draw
 - Repeat
 - (more or less)
- Update should use elapsed time information

<http://blogs.msdn.com/shawnhar/archive/2007/07/25/understanding-gametime.aspx>

Peter Drayton & Brad Merrill

Georgia Institute
of Technology

Value vs. reference types

- Like C++, C# has user defined types
- C# also makes a distinction between value types and reference types
- Value types:
 - Intrinsic types and structs
 - "Passed by value" (copied)
 - Stored on the stack (unless part of a reference type)
- Reference types:
 - Classes and interfaces, and "boxed" value types
 - "passed by reference" (implicit pointer)
 - Variables sit on the stack, but hold a pointer to an address on the heap; real object lives on heap

Georgia Institute
of Technology

Boxing and unboxing

- Boxing allows value types to be treated as reference types
 - Value boxed inside an object
 - Unboxed to get original value back
- Everything in C# is derived from "Object," so everything can be implicitly cast to an object
- Unboxing must be done explicitly

Georgia Institute of Technology

Boxing and unboxing example

```
using System;
public class UnboxingTest
{
    public static void Main()
    {
        int i = 123;
        //Boxing
        object o = i;
        // unboxing (must be explicit)
        int j = (int) o;
        Console.WriteLine("j: {0}", j);
    }
}
```

If o is null or not an int an InvalidCastException is thrown

From Jesse Liberty, "Top ten traps in C# for C++ programmers,"
www.onodotnet.com/pub/a/oreilly/dotnet/news/programmingCsharp_0801.html

Georgia Institute of Technology

Structs vs. classes

- Structs are value types
 - More efficient when used in arrays
 - Less efficient when used in collections
 - Collections expect reference types, so structs must be "boxed" - boxing has overhead
 - Support properties, methods, fields, and operators...
 - ...but not inheritance or destructions
- Classes are reference types
 - May be more efficient when used in collections

Georgia Institute of Technology

Reference parameters

- C, C++, and C# allow a function to only return one value
- In C++ and C, you can get around this by passing in pointers
- In C#:
 - Reference types in the parameter list may be changed by the function
 - To let a function change a value type in the parameter list, can use an explicit `ref` keyword:

`ref` must be used in both declaration and call

```
public void Changer(ref int x)
{
    // ...
}

Aaron.Changer(ref int aaronx);
```

Georgia Institute of Technology

Variables must be initialized

```
public void Changer(ref int x)

int aaronx;
Aaron.Changer(ref int aaronx);
```

C# will give a compile-time error since `aaronx` has not been initialized

In general, variables in C# must be assigned before being passed into a function

Georgia Institute of Technology

A clunky workaround

```
public void Changer(ref int x)

int aaronx = 0;
Aaron.Changer(ref int aaronx);
```

Georgia Institute of Technology

The out keyword

```
public void Changer(out int x)

int aaronx;
Aaron.Changer(out int aaronx);
```

out keyword like **ref**, except it tells C# that it's OK for the value to be undefined

C# will demand that you assign `aaronx` before the function returns!

Georgia Institute of Technology

C# Finalizers (1)

```
~MyClass()
{
    // your code to release unmanaged resources
    // used by object
}           is syntactic sugar for

MyClass.Finalize()
{
    // your code to release unmanaged
    // resources used by object
    base.Finalize();
} Your finalizer should not try to deal with other C#
reference objects - only deal with unmanaged resources!
```

Adapted from Jesse Liberty, "Top ten traps in C# for C++ programmers,"
www.on-dot-net.com/public/oreilly/dotnet/news/programmingCsharp_0801.html

Georgia Institute of Technology

C# Finalizers (2)

- Finalizer will be called when the .NET garbage collector decides to call it
 - You don't get to decide when it's called
- Only define a finalizer if you really need one
 - Calling it involves some overhead

Pop quiz: C

- What is the value of `b` after this code is run (assume C code)?

```
a = 7;
b = 3;
if (a = 5)
{
    b = 10;
}
```

Booleans in C#

- In C, 0 is false, "anything else" is true
- In C#, this code will give a compile time error
 - C# has distinct Boolean values, `true` and `false`

```
a = 7;
b = 3;
if (a = 5)
{
    b = 10;
}
```

C# arrays are objects

```
Java: int arr1[];
C#: int[] arr1;

arr1 = new int[5];
arr1 = new int[5] {10,20,30,40,50};
int[] arr2 = new int[5] {10,20,30,40,50};
int[] arr2 = {10,20,30,40,50};
```

Multi-dimensional arrays

```
string[,] bingo;

bingo = new string[3,2]  {{"A","B"},
    {"C","D"}, {"E","F"}};
bingo = new string[, ] {{"A","B"},
    {"C","D"}, {"E","F"}};

string[,] bingo = {{"A","B"}, {"C","D"},
    {"E","F"}};
```

Jagged arrays

- Arrays of arrays

```
int[][] arr =
new int[][]
    {new int[] {10,11,12}, new int[] {13, 14,
    15, 16, 17}};
```

Array iteration

```
int[] arr = {16, 17, 18};
foreach (int x in arr)
{
    System.Console.WriteLine(x.ToString());
}
```
